Appendix F: Stormwater System Operation and Maintenance Manual

Executive Summary

This report has been prepared in support of a Permit Application by A. Secondino & Son, Inc. to the City of Torrington for the proposed EdAdvance school building development and redevelopment of the existing Sacred Heart Church properties at 95 Grove Street (Lot 1) and 104 Grove Street (Lot 2). The existing Lot 1 is approximately 1.29 acres in size and is currently developed with an existing convent building and was the previous location of a school building demolished within the past decade. The existing Lot 2 is approximately 0.97 acres in size and is currently developed with the Sacred Heart Church building and rectory. The proposed EdAdvance school development is to be constructed on Lot 1, while work on Lot 2 consists of reconfiguration of existing parking areas. The properties are situated with Lot 1 on the western side of Grove Street and Lot 2 on the eastern side. Lot 2 is also bordered by Brook Street to the east. The parcels are bordered by residential properties on all sides. The East Branch Naugatuck River runs from north to south off of Lot 1's western boundary. A portion of the 75' wetland buffer area from alluvial wetland soils associated with the river exists on Lot 1. No existing stormwater management systems exist on either site, all stormwater runoff is discharged offsite, untreated, by overland surface flow.

The project parcels are located at a high point in elevation of Grove Street. In general, the existing topography Grove Street slopes from high point down to the north and south from approximately elevation 591' at the high point to 519' at the northern extent and 583' in the southern extent. Slopes on Lot 1 vary from approximately 2-3% along Grove Street to approximately 25% at the embankment drop-off to the west. Slopes on Lot 2 vary from 2-6% along Grove Street to approximately 67% at the embankment drop-off to Brook Street in the east. Several retaining walls exist on Lot 2 along the boundary with Brook Street supporting Lot 2 above Brook Street elevation.

Proposed site improvements will include a ±10,300 square foot school building with paved parking areas and driveways, landscaped areas, pedestrian sidewalks, site utilities and lighting, and stormwater management system upgrades. The proposed stormwater management system is designed to be in compliance with the 2002 State of Connecticut Guidelines for Soil Erosion and Sediment Control, and the 2004 State of Connecticut Stormwater Quality Manual.

A HydroCAD model, using TR-55 methodology, was developed to evaluate the existing and proposed drainage conditions of the property. The results of the analysis demonstrate that there will not be an increase in peak stormwater runoff rates for the 2-, 5-, 10-, 25-, 50-, and 100-year storm events. The proposed stormwater management system has been designed to attenuate the increased flows generated by the proposed development.

Stormwater quality is being addressed by a formalized street sweeping program, deep sump and hooded outlet catch basins, hydrodynamic separator, sediment isolator row, and an underground infiltration system. These features will provide the minimum required 80% TSS removal as required in the CT Stormwater Quality Manual.

Existing Site Conditions and Hydrologic Conditions

General Site Information

The site soil identified by the United States Department of Agriculture (USDA) Natural Resources Conservation Services (NRCS) is Hinckley-Urban Land Complex, 3 to 15 percent slopes. Per the USDA, the NRCS Hydrologic Soil Group rating for soil within the project area is A. A copy of the USDA NRCS Hydrologic Soil Group Map is included in Appendix A for reference.

Per the FEMA Flood Insurance Rate Map Number 0950810007B for the City of Torrington, Connecticut in Litchfield County, map revised date: April 4, 1983, the site resides in FEMA Flood Hazard Area C (unshaded). Zone C (unshaded) is defined as "areas determined to be outside the 500-year floodplain". A copy of the FEMA Flood insurance rate Map is included in Appendix A for reference.

Existing Hydrologic Conditions

The existing site drainage area that was analyzed totals 2.81 acres and is approximately 58.2% impervious. The existing hydrologic model includes impervious areas associated with the previously constructed and recently demolished school building that was located on Lot 1. The hydrologic model analyzes peak flows to five main design points, DP-1 through DP-5. In the existing condition, the majority of stormwater runoff from Lot 1 sheet flows from west to east and eventually conveyed into the Grove Street gutter system untreated, which is then split between flow to the south gutter (DP-2) and the north gutter (DP-3) by the local roadway high point. A small portion of Lot 1 discharges stormwater to the west toward riverine wetland areas (DP-1). The majority of stormwater runoff from Lot 2 sheet flows from west to east and eventually conveyed into the Brook Street gutter system untreated, which is then also split between flow to the south gutter (DP-4) and flow to the north gutter (DP-5) by a local roadway high point. Water runoff currently flows over the retaining walls located on the boundary with Brook Street. The peak total offsite flow is also being analyzed (DP-6).

The following is a brief analysis of the existing design points as shown on the enclosed Existing Drainage Map (ED-1) Map, in Appendix E.

Existing Drainage Area 10 (EDA-10): This drainage area consists of the portions of Lot 1 from which stormwater runoff sheet flows directly to the riverine wetland systems to the west of Lot 1 (DP-1). It is 0.28 acres and is approximately 12.8% impervious. EDA-10 consists mainly of lawn areas with a smaller contributing areas of impervious roof and paved driveway ground cover.

Existing Drainage Area 20 (EDA-20): This drainage area consists of the portions of Lots 1 and 2 from which stormwater runoff sheet flows directly into the Grove Street gutter system flowing south (DP-2). It is 1.54 acres and is approximately 81.2% impervious. EDA-20 consists of impervious paved parking, drive aisle, roadway, and roof areas located on both sides of Grove Street and including impervious areas associated with the previously demolished school building. Lawn cover contributes runoff from smaller pervious areas.

Existing Drainage Area 30 (EDA-30): This drainage area consists of the portions of Lots 1 and 2 from which stormwater runoff sheet flows directly into the Grove Street gutter system flowing north (DP-3). It is 0.21 acres and is approximately 55.1% impervious. EDA-30 consists of impervious paved parking, drive aisle, roadway, and roof areas located west of Grove Street associated with the existing convent building and rectory. Lawn cover contributes runoff from smaller pervious areas.

Existing Drainage Area 40 (EDA-40): This drainage area consists of the portions of Lot 2 from which stormwater runoff sheet flows directly into the Brook Street gutter system flowing south (DP-4). It is 0.51 acres and is approximately 36.6% impervious. EDA-40 consists of impervious paved parking, drive aisle, roadway, and roof areas located east of Grove Street associated with the existing church and rectory building. Lawn cover contributes runoff from pervious areas.

Existing Drainage Area 50 (EDA-50): This drainage area consists of the portions of Lot 2 from which stormwater runoff sheet flows directly into the Brook Street gutter system flowing north (DP-5). It is 0.26 acres and is approximately 17.3% impervious. EDA-50 consists of impervious paved parking, drive aisle, roadway, and roof areas located east of Grove Street associated with the existing church and rectory building. Lawn cover contributes runoff from pervious areas.

Table 1 – Pre-Development Drainage Characteristics

Drainage Area	Area (square feet)	Composite Curve Number	Impervious Cover (%)	Time of Concentration (minutes)
EDA-10 (Area Draining Offsite West)	12,270	55	12.8	5.0
EDA-20 (Area to Grove Street South)	67,225	89	81.2	7.1
EDA-30 (Area to Grove Street North)	9,035	76	55.1	6.1
EDA-40 (Area to Brook Street South)	22,400	67	36.3	5.0
EDA-50 (Area to Brook Street North)	11,465	57	17.3	5.0

Developed Site Conditions and Hydrologic Conditions

In the proposed condition, stormwater collection and conveyance systems will be installed on site and will be supplemented with an underground stormwater detention system installed to mitigate the increase in peak flow from the site as a result of increased impervious cover in the water quality storm event. The underground detention system will also serve to detain and infiltrate the required water quality volume. The proposed stormwater system will also provide water quality improvements through the implementation of a formalized street sweeping program for the impervious surfaces and the installation of deep sump and hooded outlet catch basins, a sediment isolator row, and the underground infiltration system. These measures will treat the stormwater quality flow through structural means to provide water quality treatment in conformance with the State of Connecticut Water Quality Manual.

The proposed site drainage area totals 2.81 acres and is approximately 60.2% impervious. For the hydrologic analysis, the developed site retained the same Design Points as the existing model. The following sub-drainage areas were developed to model the proposed site improvements.

Proposed Drainage Area 100 (PDA-100): This drainage area consists of the portions of Lot 1 from which stormwater runoff will continue to sheet flow directly to the riverine wetland systems to the west of Lot 1 (DP-1), bypassing stormwater collection systems. It is 0.43 acres and is approximately 7.1% impervious. PDA-100 consists mainly of lawn areas with smaller contributing areas of impervious roof from the existing convent building and concrete pads.

Proposed Drainage Area 110 (PDA-110): This drainage area consists of the proposed paved parking area located south of the proposed school building on Lot 1. Stormwater runoff from this area is collected in catch basin inlets and conveyed through subsurface piping into the underground detention system (UDS). The UDS will be outfitted with a sediment isolator row for water quality treatment prior to discharge into the water quality volume and peak flow mitigation portion of the UDS. The UDS will discharge to a level spreader system for velocity dissipation prior to ultimately discharging to the riverine wetland systems to the west of Lot 1 (DP-1). It is 0.25 acres and is approximately 81.9% impervious. PDA-110 consists mainly of paved parking and drive aisle areas with smaller portions of lawn and landscaped surface cover.

Proposed Drainage Area 120 (PDA-120): This drainage area consists of the proposed EdAdvance school building roof. Stormwater runoff from the roof will be conveyed through subsurface piping into the underground detention system (UDS). The UDS will discharge to a level spreader system for velocity dissipation prior to ultimately discharging to the riverine wetland systems to the west of Lot 1 (DP-1). It is 0.24 acres and is entirely impervious.

Proposed Drainage Area 130 (PDA-130): This drainage area consists of the proposed paved parking area located south of the existing church building on Lot 2. Stormwater runoff from this area is collected in catch basin inlets and conveyed through subsurface piping into the underground detention system (UDS) on Lot 1. The UDS will be outfitted with a sediment isolator row for water quality treatment prior to discharge into the water quality volume and peak flow mitigation portion of the UDS. The UDS will discharge to a level spreader system for velocity dissipation prior to ultimately discharging to the riverine wetland systems to the west of Lot 1 (DP-1). It is 0.19 acres and is approximately 84.6% impervious. PDA-130 consists mainly of paved parking and drive aisle areas with smaller portions of lawn and landscaped surface cover.

Proposed Drainage Area 140 (PDA-140): This drainage area consists of the proposed paved parking area located to the north, east, and south of the existing rectory building on Lot 2. Stormwater runoff from this area is collected in catch basin inlets and conveyed through subsurface piping into the underground detention system (UDS) on Lot 1. The UDS will be outfitted with a sediment isolator row for water quality treatment prior to discharge into the water quality volume and peak flow mitigation portion of the UDS. The UDS will discharge to a level spreader system

for velocity dissipation prior to ultimately discharging to the riverine wetland systems to the west of Lot 1 (DP-1). It is 0.27 acres and is approximately 74.4% impervious. PDA-140 consists mainly of paved parking and drive aisle areas with smaller portions of lawn and landscaped surface cover. The rear half of the existing rectory building also drains to this area.

Proposed Drainage Area 200 (PDA-200): This drainage area consists of the portions of Lots 1 and 2 from which stormwater runoff will continue to sheet flow directly into the Grove Street gutter system flowing south (DP-2). It is 0.89 acres and is approximately 73.0% impervious. PDA-200 consists of impervious paved parking, drive aisle, and roadway areas located on both sides of Grove Street and including roof areas from the existing church and convent buildings on the east side of the street that will continue to drain as they do in existing condition. Lawn cover contributes runoff from smaller pervious areas.

Proposed Drainage Area 300 (PDA-300): This drainage area consists of the portions of Lots 1 and 2 from which stormwater runoff will continue to sheet flow directly into the Grove Street gutter system flowing north (DP-3). It is 0.20 acres and is approximately 56.2% impervious. PDA-300 consists of impervious paved parking, drive aisle, roadway, and roof areas located on both sides of Grove Street associated with the existing convent building and rectory. Lawn cover contributes runoff from smaller pervious areas.

Proposed Drainage Area 400 (PDA-400): This drainage area consists of the portions of Lot 2 from which stormwater runoff will continue to sheet flow directly into the Brook Street gutter system flowing south (DP-4). It is 0.25 acres and is approximately 36.3% impervious. PDA-400 consists of impervious paved parking, drive aisle, roadway, and roof areas located east of Grove Street associated with the existing church and rectory building. Lawn cover contributes runoff from pervious areas.

Proposed Drainage Area 500 (PDA-500): This drainage area consists of the portions of Lot 2 from which stormwater runoff will continue to sheet flow directly into the Brook Street gutter system flowing north (DP-5). It is 0.09 acres and is approximately 1.1% impervious. PDA-500 consists of impervious paved parking, drive aisle, roadway, and roof areas located east of Grove Street associated with the existing church and rectory building. Lawn cover contributes runoff from pervious areas.

Table 3 – Post-Development Drainage Characteristics

Drainage Area	Area (square feet)	Composite Curve Number	Impervious Cover (%)	Time of Concentration (minutes)

Stormwater Management

Hydrologic Modeling of the Entire Site

The hydrologic analysis to determine peak stormwater discharge rates was performed using the HydroCAD stormwater modeling system computer program, version 10.00 developed by HydroCAD Software Solutions, LLC. Hydrographs for each watershed were developed using the SCS Synthetic Unit Hydrograph Method. Rainfall depths and distribution per the NOAA Atlas 14 for Torrington, CT were used for the calculation of peak flow rates and are listed in Table 6. The drainage areas, or subcatchments as labeled by the program, are depicted by hexagons on the

attached drainage diagrams. Pre-development HydroCAD output can be found in Appendix B and Post-development HydroCAD output can be found in Appendix C.

Table 6 – Rainfall Depths per NOAA Atlas 14

Return Period	24-hour Rainfall Depth
1" depth	1.00"
2-year	3.52"
5-year	4.72"
10-year	5.71"
25-year	7.07"
50-year	8.07"
100-year	9.18"

Stormwater Quality

Along with the reduction of the overall total peak stormwater discharge rate, an important element of the proposed drainage system is to improve the quality of stormwater leaving the property. Per the DEEP 2004 Stormwater Quality Manual "The pollutant reduction criterion is designed to improve the water quality of stormwater discharges by treating a prescribed water quality volume or associated peak flow, referred to as the water quality flow. Most treatment practices described in this Manual use a volume-based sizing criterion. The exceptions are grass drainage channels, proprietary stormwater treatment devices, and flow diversion structures, where a peak flow rate is utilized." To adhere to the pollution reduction criteria of the manual, numerous Best Management Practices (BMPs) have been implemented in this design. The most basic preventive measure of the stormwater treatment train is to implement regular sweeping of the paved areas and annual cleaning of the catch basin sumps, underground detention system, and sediment isolator row, which allows continuous proper function of stormwater systems and prevents sediment from reaching outlet locations. The operation and maintenance manual for the application will have a standard required pavement sweeping schedule.

A variety of stormwater collection and treatment systems will be implemented in the proposed project. Water quality improvements will be installed through utilization of a sediment isolator row for removal of total suspended solids (TSS) as well as hydrocarbons including gasoline and oil. Regular maintenance, including removing the existing debris and sediment within each of the existing catch basins and proposed catch basins on site, shall be implemented to improve the overall removal of TSS and hydrocarbons within the existing system. Runoff from the proposed

development area will be piped to the sediment isolator row for treatment prior to discharge into underground stormwater detention systems for infiltration and ultimately conveyed offsite to the western wetland area. The underground detention system will also provide stormwater settling potential for further TSS and oil capture potential, to be removed offsite with proper maintenance. As a result of the various treatment systems, significant stormwater quality improvements are being provided for the site which currently operates with no treatment devices installed. The sediment isolator row works in conjunction with a flow splitter manhole to divert the 1" depth water quality flow into the isolation chambers.

All catch basins in new parking and/or paved areas will have a minimum of four-foot-deep sumps to collect sediment carried in the runoff. Catch basins in grassed areas will also have four-foot-deep sumps. The standard sump required by the CTDOT drainage manual is 2 feet. The additional 2 feet of sump depth will help to remove more sediment from the stormwater runoff. All catch basin outlets will be fitted with 'hoods' which remove floating debris and petroleum based contaminates as they float to the surface in the individual catch basin and are impounded in the structure so they can be properly removed during regular maintenance.

In addition to the WQF, the required sitewide water quality volume (WQV) will also be detained and infiltrated on site. The proposed underground detention system will detain and infiltrate the required water quality volume for the site per the DEEP 2004 Stormwater Quality Manual as shown in the Water Quality Volume Calculations found in Appendix D. Water Quality Flow calculations can also be found in Appendix D.

Summary

The post-development total peak discharge rate for the total developed site has been decreased for all storm events. The proposed underground stormwater detention system has been designed to attenuate peak flows for the 1" depth water quality and 2-year storm events for flows directed toward the western wetland area. Stormwater quality is being addressed by a formalized street sweeping program, deep sump and hooded outlet catch basins, hydrodynamic separator, sediment isolator row, and an underground infiltration system. These features will provide the minimum required 80% TSS removal as required in the CT Stormwater Manual. The proposed stormwater management system will meet the stormwater quality requirements of the State of Connecticut.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:12,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

[1] Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.

APPENDIX D

WATER QUALITY CALCULATIONS

CTDEEP Water Quality Volume Calculations
CTDEEP Water Quality Flow Calculations
CTDEEP Groundwater Recharge Calculations
HydroCAD WQV Stage Volume Table
CTDOT Hydrodynamic Separator Sizing
Treatment Train Efficiency Worksheet

Water Quality Calculations

Determine Water Quality Volume

From CT 2004 Stormwater Quality Manual, Section 7.4.1:

$$WQV = \frac{(1")(R)(A)}{12}$$

$$R = 0.05 + 0.009(I)$$

WQV = water quality volume (ac-ft)
R = volumetric runoff coefficient
I = percent impervious cover
A = site area in acres

Area	Total Area		Impervious Area		Impervious Cover	Volumetric Runoff Coefficient	Water Quality Volume (WQV)		Water Quality Volume Provided
ID	ac	ft^2	ac	ft^2	%	R	acre-feet	ft^3	ft^3
Site Area	2.323	101,208	1.227	53,450	52.82	0.525	0.102	4,443	5,884

Note: The provided Water Quality Volume for the Underground detention System was derived from the Stage Volume tables in HydroCAD as the volume below the first orifice elevation from Pond 1P: Underground Stormwater Detention System (100.18').

Water Quality Calculations

Determine Water Quality Flow

From CT 2004 Stormwater Quality Manual:

$$CN = \frac{1000}{\left[10 + 5P + 10Q - 10\left(Q^2 + 1.25QP\right)^{\frac{1}{2}}\right]}$$

$$Q = \frac{[WQV\,(acre-feet)\times[12(inches/foot)]]}{DrainageArea(acres)}$$

$$WQF = (q_u)(A)(Q)$$

CN = Runoff Curve Number
P = design preciptation, inches, (1" for water quality storm)
Q = runoff depth (in watershed inches)
T_c = time of concentration
I_a = Initial abstraction, inches, from Table 4-1, Chapter 4, TR-55
q_u = unit peak discharge,
WQF = water quality flow (cfs)

Structure		Total Area			Imp Area		Imp Cover	R	WQV	Q	P	CN	T_c		I_a	I_a/P	q_u *	WQF
		ft^2	ac	mi^2	ft^2	ac	%	-	acre-feet	in	in	-	mins	hours	in	-	$cfs/mi^2/in$	cfs
Isolator Row	Underground Detention System	30,765	0.706	0.0011	24,550	0.564	79.80	0.768	0.045	0.76	1.00	98	5.0	0.08	0.041	0.041	650	0.54
CB-10	Inlet Hydrodynamic separator	8,300	0.191	0.0003	6,400	0.147	77.11	0.744	0.012	0.75	1.00	98	5.0	0.08	0.041	0.041	650	0.15

* From Exhibit 4-III: Unit peak discharge (qu) for SCS type III rainfall distribution, Urban Hydrology for Small Watersheds (TR-55), USDS< SCS, June 1986.

Groundwater Recharge Volume Calculations

Groundwater Recharge Volume

From CT 2004 Stormwater Quality Manual:

$$GVR = \frac{(D)(A)(I)}{12}$$

GRV Groundwater Recharge Volume (ac-ft)
D = Depth of Runoff to be Recharged (table 7-4)
A = site area in acres
I = impervious cover (decimal)

A I

Table of Contents

General Overview

The project parcel, located at 95-104 Grove Street, is approximately 1.29 acres in size and is currently developed with an existing convent building and was the previous location of a school building demolished within the past decade. The existing Lot 2 is approximately 0.97 acres in size and is currently developed with the Sacred Heart Church building and rectory. The proposed EdAdvance school development is to be constructed on Lot 1, while work on Lot 2 consists of reconfiguration of existing parking areas. The properties are situated with Lot 1 on the western side of Grove Street and Lot 2 on the eastern side. Lot 2 is also bordered by Brook Street to the east. The parcels are bordered by residential properties on all sides. The East Branch Naugatuck River runs from north to south off Lot 1's western boundary.

The project parcels are located at a high point in elevation of Grove Street. In general, the existing topography Grove Street slopes from high point down to the north and south from approximately elevation 591' at the high point to 519' at the northern extent and 583' in the southern extent. Slopes on Lot 1 vary from approximately 2-3% along Grove Street to approximately 25% at the embankment drop-off to the west. Slopes on Lot 2 vary from 2-6% along Grove Street to approximately 67% at the embankment drop-off to Brook Street in the east. Several retaining walls exist on Lot 2 along the boundary with Brook Street supporting Lot 2 above Brook Street elevation.

Proposed site improvements include a ±10,300 square foot school building with paved parking areas and driveways, landscaped areas, pedestrian sidewalks, site utilities and lighting, and stormwater management system upgrades. The proposed stormwater management system is designed to be in compliance with the 2002 State of Connecticut Guidelines for Soil Erosion and Sediment Control, and the 2004 State of Connecticut Stormwater Quality Manual.

The following Operations and Maintenance Plan was prepared specifically for this proposed development in the City of Torrington, Connecticut. The Plan was developed to satisfy the requirements of the Connecticut Department of Energy and Environmental Protection's 2002 Connecticut Guidelines for Soil Erosion and Sediment Control.

Purpose & Goals

The purpose of this Manual is to ensure that the stormwater management components are operated in accordance with all approvals and permits. The primary goal is to inform all the property managers about how the system operates and what maintenance items are necessary to protect downstream wetlands and watercourses. The secondary goal is to provide a practical, efficient means of maintenance planning and record keeping to verify permit compliance.

Responsible Parties

The Property Owner will be responsible for implementing the Plan on the property.

Maintenance inspections shall be performed by a qualified professional.

Some utilities located on the site will be owned and maintained by various utility companies in accordance with their standards. The property owner may maintain the service connections.

List of Permits & Special Conditions

The project will receive several permits, which may contain special conditions that require compliance by the property owner and maintenance contractors. This permit may include the following:

- City of Torrington – Wetlands Permit, Site Plan Permit, Demolition Permit, and Building Permit

Maintenance Logs and Checklists

The property owner will keep a record of all maintenance procedures performed, date of inspection/ cleanings, etc. Copies of inspection reports and maintenance records shall be kept on-site.

Forms

The following forms will be developed for annual maintenance. Copies of the forms will be kept on-site as part of the Storm Water Management Plan.

- Annual Checklist
- Quarterly Checklist
- Monthly Checklist

Employee Training

The property owner will have an employee-training program, with annual up-dates, to ensure that the qualified employees charged with maintaining the buildings and grounds do so in accordance with the approved permit conditions. All employees that have maintenance duties will be adequately informed of their responsibilities.

Spill Control

In addition to the good housekeeping and material management practices discussed in the previous sections of this plan, the following practices will be followed for spill prevention and clean-up:

- Manufacturer's recommended methods for spill clean-up will be clearly posted and site personnel will be made aware of the procedures and the location of the information and clean-up supplies.

- Materials and equipment necessary for spill clean-up will be kept in the material storage area on-site. Equipment and materials will include but not be limited to: absorbent booms or mats, brooms, dust pans, mops, rags, gloves, goggles, sand, and plastic and metal trash containers specifically for this purpose.
- All spills will be cleaned immediately after discovery.
- The spill area will be kept well-ventilated and personnel will wear appropriate protective clothing to prevent injury from contact with hazardous substance.
- Spills of toxic or hazardous material, regardless of size, will be reported to the appropriate State or local government agency.
- If a spill occurs, this plan will be adjusted to include measures to prevent this type of spill from reoccurring and how to clean the spill if there is another one. A description of the spill, the cause, and the remediation measures will also be included.

A spill report shall be prepared by the property owner following each occurrence. The spill report shall present a description of the release, including quantity and type of material, date of spill, circumstances leading to the release, location of spill, response actions and personnel, documentation of notifications and corrective measures implemented to prevent reoccurrence.

The property owner shall identify an appropriately qualified and trained site employee involved with day-to-day site operations to be the spill prevention and clean-up coordinator. The name(s) of responsible spill personnel shall be posted on-site. Each employee shall be instructed that all spills are to be reported to the spill prevention and clean-up coordinator.

Storm Water Management

System Components

The storm water management system has several components that are shown on the Grading and Drainage Plan (GD-1), that performs various functions in treating storm water runoff:

Catch Basins and Manholes

The property owner is responsible for cleaning the catch basins and manholes on the property. A Connecticut Licensed hauler shall clean the sumps and dispose of removed sand legally. The road sand may be reused for winter sanding but may not be stored on-site. As part of the hauling contract, the hauler shall notify the property owner in writing where the material is being disposed.

Each catch basin shall be inspected every four months, with one inspection occurring during the month of April. Any debris occurring within one foot from the bottom of each sump shall be removed by Vacuum "Vactor" type of maintenance equipment.

During the inspection of each of the catch basin sumps, the hoods (where provided) on each of the outlet pipes shall also be observed for trash accumulation as well as overall condition. In the event that a hood is damaged or off the hanger, it shall be reset or repaired.

Isolator Row and Underground Detention System

The underground detention system and Isolator Row shall be inspected every six months in the months of April and September. Each of the inspection ports provided shall be opened and visually checked from the surface. Observation of grit inside of the detention system shall be noted and any deposits found to be 2 inches or more, as measured from the invert of pipe, shall be cleaned and removed. The underground detention system qualifies as a Confined Space under OSHA regulations, and any maintenance involving entry into the pipes should comply with OSHA Confined Space Entry Regulations.

Hydrodynamic Separator (or Approved Equal)

The hydrodynamic separator shall be cleaned periodically during construction, with one cleaning and inspection occurring at the end of construction after landscaped areas are fully stabilized.

For the first year of operation following construction, inspect each structure once each month during January, February, March, and April, and once every four months thereafter. A graduated measuring device (stadia rod) shall be inserted into each grit chamber and measurements of any accumulations shall be recorded. Any debris, which has accumulated to within one foot of the water surface inside the grit chamber portion of each tank, shall be removed by vacuum "Vactor" type equipment.

After the first year of operation, each structure shall be inspected at a minimum, three times yearly with one inspection occurring in the month of April in the same manner as described above for the first season of operation. Any accumulations found to be occurring within one foot of the water surface shall be removed from the structure and properly disposed off-site. Also, any floating material discovered during inspections shall be removed from the tank.

Level Spreader

Catch basins draining to the level spreader, including the level spreader junction catch basin, level spreader stone trench and curbing, and the area downstream from the level spreader shall be inspected for clogging, density of vegetation, damage by foot or vehicular traffic, excessive accumulations, and channelization. Inspections shall be made on a quarterly basis for the first two years following installation, and then on a semiannual basis thereafter. Inspections shall be performed after every storm event greater than 1-inch.

Catch basins draining to level spreaders shall be cleaned when sediment accumulation reaches a depth of 1', or on a minimum annual basis. Sediment and debris shall be removed from downstream areas on a minimum semiannual basis or whenever buildup is observed. Regrading and reseeding may be necessary to perform the maintenance procedure.

Site Maintenance

Parking Lots

Parking lots and sidewalks shall be swept as necessary by the property owner, or at least once per year, to clean sediment, trash, and other debris. The property owner will sweep parking lots on the property in the spring to remove winter accumulations of road sand.

Landscaping

The management company retained by the property owner will maintain landscaped areas. Normally the landscaping maintenance will consist of pruning, mulching, planting, mowing lawns, raking leaves, etc. Use of fertilizers and pesticides will be controlled and limited to minimal amounts necessary for healthy landscape maintenance.

The lawn areas, once established, will be maintained at a typical height of 3 ½". This will allow the grass to be maintained with minimal impact from weeds and/or pests. The low-maintenance areas will be maintained as a meadow or allowed to revert back to natural conditions. Topsoil, brush, leaves, clippings, woodchips, mulch, equipment, and other material shall be stored off site.

Outdoor Storage

There will be no outdoor storage of hazardous chemicals, de-icing agents, fertilizer, pesticides, or herbicides anywhere around the buildings.

Deicing and Snow Removal & Storage

The use of clean sand may be used to aid traction in conjunction with salt and/or chemicals for deicing, snow melting and other related winter weather management. Snow shall be shoveled and plowed from sidewalk and parking areas as soon as practical during and after winter storms. Sand accumulation shall be removed from the site at the end of the winter season or appropriate time when seasonal snow has melted. Alternative deicing methods must be submitted prior to use onsite for review to the City of Torrington for approval.

MAINTENANCE SCHEDULE

During the First Year of Operation:		
Task:	Completion Date:	Manager's Initials:
JANUARY:		
Employee Training Program with Spill Program		
*Catch Basin Inspection		
*Isolator Row and Subsurface Stormwater Detention		
*Hydrodynamic Separator Inspection		
Level Spreader Inspection		
FEBRUARY:		
*Isolator Row and Subsurface Stormwater Detention		
*Hydrodynamic Separator Inspection		
MARCH:		
*Isolator Row and Subsurface Stormwater Detention		
*Hydrodynamic Separator Inspection		
APRIL:		
*Catch Basin Inspection		
*Isolator Row and Subsurface Stormwater Detention		
*Hydrodynamic Separator Inspection		
Level Spreader Inspection		
Sweeping of Paved Surfaces		
Shrub Fertilization		
Lawn Liming (if necessary)		
JUNE:		
*Catch Basin Inspection		
Sweeping of Paved Surfaces		
SEPTEMBER:		
*Isolator Row and Subsurface Stormwater Detention		
Level Spreader Inspection		
Sweeping of Paved Surfaces		
Tree and Lawn Fertilization		
DECEMBER:		
*Catch Basin Inspection		
*Isolator Row and Subsurface Stormwater Detention		
Level Spreader Inspection		
Sweeping of Paved Surfaces		

*NOTE: Use appropriate worksheet found in this plan to conduct the inspection.

After the First Year of Operation:			
FOR YEAR_____			
Task:		Completion Date:	Manager's Initials:

On-site Procedures for Inspection and Maintenance of Catch Basin Inserts

- Secure traffic and pedestrian traffic with cones, barrels, etc.
- Clean surface area around each catch basin.
- Remove grates and set aside
- Clean grates, remove litter and debris that may be trapped within the grate
- Visually inspect condition of outlet hood and remove trash and debris from hood if necessary.
- Remove by vactor hose the debris that has been trapped in the trough area. Dispose of in accordance with local, state and federal regulatory agency requirements. Most debris that is captured in the trough or sump area will fall into the non-hazardous waste category.
- Visually inspect and check the condition of the trough area.
- Replace grate and lockdown as needed.
- Un-secure traffic control area.
- Complete service report and submit to facility owner.

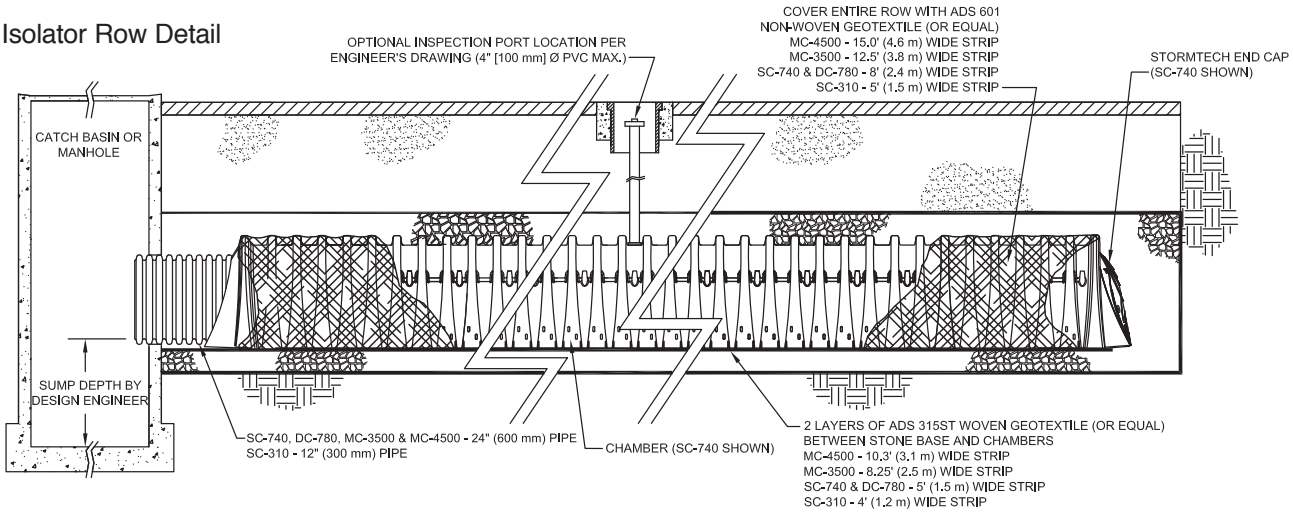
1 – Sediment deposits shall be removed from the subsurface detention basin when the deposited material reaches a height of 2” measured from the top of the stone bedding.

StormTech and Stormwater Quality

StormTech's patented Isolator™ Row is a row of chambers wrapped in a geotextile which filters the stormwater trapping pollutants in the row. The Isolator Row provides a way to inspect and maintain the system.

Isolator Row Detail



Note: For many applications, the non-woven geotextile over the DC-780, MC-3500 and MC-4500 Isolator Row chambers can be eliminated or substituted with the AASHTO Class 1 woven geotextile. Contact your StormTech representative for assistance.

Isolator Row Field Verification Testing at the University of New Hampshire Stormwater Center

- Field testing (TARP tier II protocol) of the Isolator Row has been ongoing since December 2006.
- Removal efficiencies for TSS have improved as the filter cake has built up on the bottom fabric of the Isolator Row.
- Current data shows a TSS removal efficiency which exceeds 80%.

Removal Efficiency Results:

- Total Suspended Solids = 80%
- Phosphorous = 49%
- Total Petroleum Hydrocarbons = 90%
- Zinc = 53%

This system achieves a removal efficiency of 80% for TSS which meets most municipal recommended levels for water quality treatment.

Inspection and Maintenance

The Isolator Row can be inspected through the upstream manhole or optional inspection port.

Maintenance is easily accomplished with the JetVac process.

The frequency of inspection and maintenance varies by location. Contact StormTech for assistance with inspection and maintenance scheduling.

THE ISOLATOR® ROW

INTRODUCTION

An important component of any Stormwater Pollution Prevention Plan is inspection and maintenance. The StormTech Isolator Row is a technique to inexpensively enhance Total Suspended Solids (TSS) and Total Phosphorus (TP) removal with easy access for inspection and maintenance.

THE ISOLATOR ROW

The Isolator Row is a row of StormTech chambers, either SC-160, SC-310, SC-310-3, SC-740, DC-780, MC-3500 or MC-4500 models, that is surrounded with filter fabric and connected to a closely located manhole for easy access. The fabric-wrapped chambers provide for settling and filtration of sediment as storm water rises in the Isolator Row and ultimately passes through the filter fabric. The open bottom chambers and perforated sidewalls (SC-310, SC- 310-3 and SC-740 models) allow storm water to flow both vertically and horizontally out of the chambers. Sediments are captured in the Isolator Row protecting the storage areas of the adjacent stone and chambers from sediment accumulation.

A woven geotextile fabric is placed between the stone and the Isolator Row chambers. The woven geotextile provides a media for stormwater filtration, a durable surface for maintenance, prevents scour of the underlying stone and remains intact during high pressure jetting. A non-woven fabric is placed over the chambers to provide a filter media for flows passing through the perforations in the sidewall of the chamber. The non-woven fabric is not required over the SC-160, DC-780, MC-3500 or MC-4500 models as these chambers do not have perforated side walls.

The Isolator Row is typically designed to capture the “first flush” and offers the versatility to be sized on a volume basis or flow rate basis. An upstream manhole provides access to the Isolator Row and typically includes a high flow weir. When flow rates or volumes exceed the Isolator Row weir capacity the water will flow over the weir and discharge through a manifold to the other chambers.

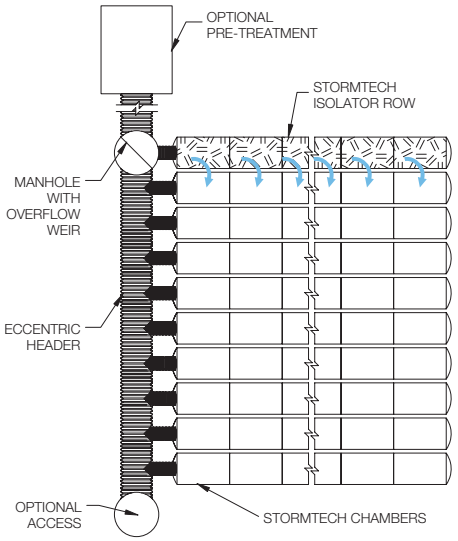
Another acceptable design uses one open grate inlet structure. Using a “high/low” design (low invert elevation on the Isolator Row and a higher invert elevation on the manifold) an open grate structure can provide the advantages of the Isolator Row by creating a differential between the Isolator Row and manifold thus allowing for settlement in the Isolator Row.

The Isolator Row may be part of a treatment train system. The design of the treatment train and selection of pretreatment devices by the design engineer is often driven by regulatory requirements. Whether pretreatment is used or not, the Isolator Row is recommended by StormTech as an effective means to minimize maintenance requirements and maintenance costs.

Note: See the StormTech Design Manual for detailed information on designing inlets for a StormTech system, including the Isolator Row.

Looking down the Isolator Row from the manhole opening, woven geotextile is shown between the chamber and stone base.

StormTech Isolator Row with Overflow Spillway (not to scale)



ISOLATOR ROW INSPECTION/MAINTENANCE

INSPECTION

The frequency of inspection and maintenance varies by location. A routine inspection schedule needs to be established for each individual location based upon site specific variables. The type of land use (i.e. industrial, commercial, residential), anticipated pollutant load, percent imperviousness, climate, etc. all play a critical role in determining the actual frequency of inspection and maintenance practices.

At a minimum, StormTech recommends annual inspections. Initially, the Isolator Row should be inspected every 6 months for the first year of operation. For subsequent years, the inspection should be adjusted based upon previous observation of sediment deposition.

The Isolator Row incorporates a combination of standard manhole(s) and strategically located inspection ports (as needed). The inspection ports allow for easy access to the system from the surface, eliminating the need to perform a confined space entry for inspection purposes.

If upon visual inspection it is found that sediment has accumulated, a stadia rod should be inserted to determine the depth of sediment. When the average depth of sediment exceeds 3 inches throughout the length of the Isolator Row, clean-out should be performed.

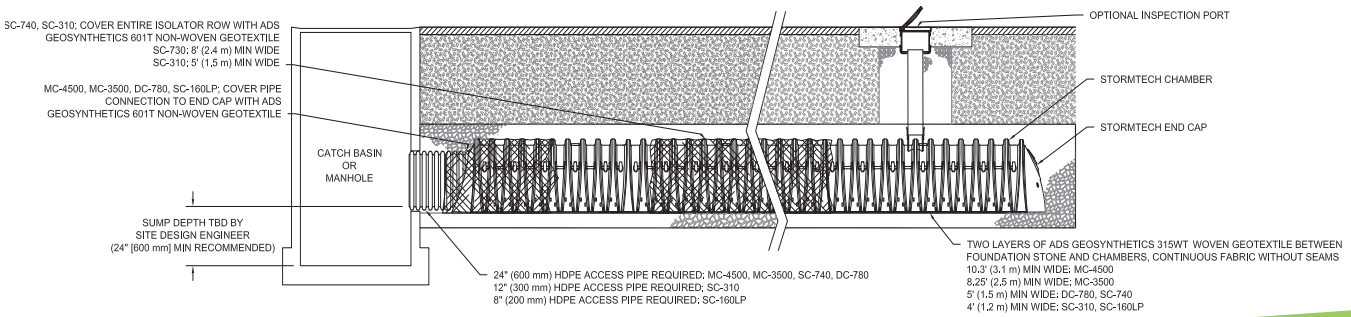
MAINTENANCE

The Isolator Row was designed to reduce the cost of periodic maintenance. By "isolating" sediments to just one row, costs are dramatically reduced by eliminating the need to clean out each row of the entire storage bed. If inspection indicates the potential need for maintenance, access is provided via a manhole(s) located on the end(s) of the row for cleanout. If entry into the manhole is required, please follow local and OSHA rules for a confined space entries.

Maintenance is accomplished with the JetVac process. The JetVac process utilizes a high pressure water nozzle to propel itself down the Isolator Row while scouring and suspending sediments. As the nozzle is retrieved, the captured pollutants are flushed back into the manhole for vacuuming. Most sewer and pipe maintenance companies have vacuum/JetVac combination vehicles. Selection of an appropriate JetVac nozzle will improve maintenance efficiency. Fixed nozzles designed for culverts or large diameter pipe cleaning are preferable. Rear facing jets with an effective spread of at least 45" are best. Most JetVac reels have 400 feet of hose allowing maintenance of an Isolator Row up to 50 chambers long. **The JetVac process shall only be performed on StormTech Isolator Rows that have AASHTO class 1 woven geotextile (as specified by StormTech) over their angular base stone.**

StormTech Isolator Row (not to scale)

Note: Non-woven fabric is only required over the inlet pipe connection into the end cap for SC-160LP, DC-780, MC-3500 and MC-4500 chamber models and is not required over the entire Isolator Row.



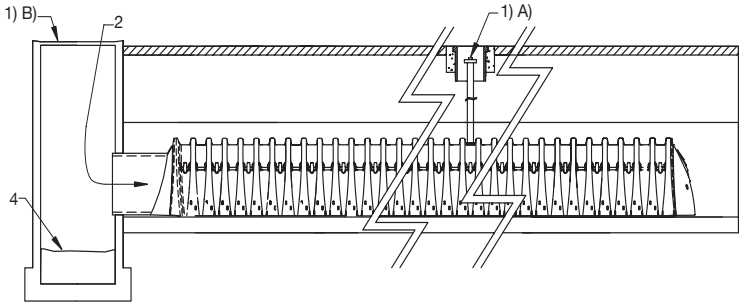
ISOLATOR ROW STEP BY STEP MAINTENANCE PROCEDURES

STEP 1
Inspect Isolator Row for sediment.
- A) Inspection ports (if present)
  - i. Remove lid from floor box frame
  - ii. Remove cap from inspection riser
  - iii. Using a flashlight and stadia rod,measure depth of sediment and record results on maintenance log.
  - iv. If sediment is at or above 3 inch depth, proceed to Step 2. If not, proceed to Step 3.
- B) All Isolator Rows
  - i. Remove cover from manhole at upstream end of Isolator Row
  - ii. Using a flashlight, inspect down Isolator Row through outlet pipe
    1. Mirrors on poles or cameras may be used to avoid a confined space entry
    2. Follow OSHA regulations for confined space entry if entering manhole
  - iii. If sediment is at or above the lower row of sidewall holes (approximately 3 inches), proceed to Step 2. If not, proceed to Step 3.

STEP 2
Clean out Isolator Row using the JetVac process.
- A) A fixed floor cleaning nozzle with rear facing nozzle spread of 45 inches or more is preferable
- B) Apply multiple passes of JetVac until backflush water is clean
- C) Vacuum manhole sump as required

STEP 3
Replace all caps, lids and covers, record observations and actions.

STEP 4
Inspect & clean catch basins and manholes upstream of the StormTech system.



SAMPLE MAINTENANCE LOG

Date	Stadia Rod Readings		Sediment Depth (1)–(2)	Observations/Actions	Inspector
	Fixed point to chamber bottom (1)	Fixed point to top of sediment (2)
