

Electricity Safety Tips

- * Never touch, kick, pull or attempt to pick up a fallen wire or anything in contact with a downed wire. Even a telephone wire could be deadly if tangled with a power line some distance away.
- * When working outside, avoid contact with overhead power lines or exposed wires. Especially when working with ladders or antennas.
- * If you smell gas, do not turn on any electrical appliance or light switch. Leave the home immediately and call for assistance.
- * Do not place electric cords so that they run across doorways or under carpets.
- * Only use the correct plugs with their receptacles. If needed you can buy an adaptor for 2 prong receptacles.
- * Water conducts electricity! Do not touch any electrical switch while you hands are wet. Hair-dryers, curling irons, or any other electrical appliance should never be used where cords could hang in a sink or other water source.
- * Replace all blown fuses or defective breakers with the proper size.
- * Never fly kites near power lines.
- * All convenience outlets for outdoor use should be weatherproof and have ground fault interrupters.
